

Catalog kit — CareBot Catch & Cage

(Theater)

Everything needed to **share this demo with others** and deliver it to customers. Written for people who did not build it.

Asset	Answers	Read it when
One-pager	What is this, who is it for, what do they take away?	You are listing it on a catalog page or pitching it internally
Architecture	What is actually happening, and what is real versus simulated?	A technical audience asks, or you are briefing an SE
Bill of materials	What does the Theater need, what does it cost, how long is setup?	You are planning a Theater delivery
Video script	How do I record a 5-minute walkthrough for other SEs?	You are making an enablement video, or learning to deliver it yourself

The architecture diagrams are **Excalidraw** drawings in `diagrams/`. Each ships as an `.svg` that renders on GitHub and an `.excalidraw` source you can open at excalidraw.com to rebrand, translate or lift a panel straight into a slide.

Send-ready downloads

For emailing, printing, or dropping into a deck without needing to render anything yourself.

Format	Where	Use it for
PDF	pdf/	Emailing a customer or a Hub Director, printing a checklist
PNG	<code>diagrams/png/</code>	Pasting a diagram into PowerPoint or Word

The PNGs are rendered at 3x (about 3200 to 4200 px wide), so they stay sharp full-bleed on a slide. Prefer the `.svg` wherever it renders, since it scales without loss.

Download the PDFs, do not preview them here. Every cross-reference in them is a working hyperlink, but GitHub shows a PDF inside a sandboxed viewer where links do not fire, so previewing one in the browser makes them all look dead. Download the file and open it in Acrobat, Edge or any normal reader and they work. Nothing is wrong with the file.

These are generated, not source. Every PDF is rendered from the markdown next to it, and every PNG from the matching **.svg**. **The markdown and the .excalidraw files are the source of truth.** Edit those, never these. A PDF footer carries the date it was generated, so you can tell when one has fallen behind the doc it came from.

Run it: aka.ms/hub/carebot-demo — the Hub link. Sign in with your Microsoft account; it is gated to the tenant, so attendee phones cannot join anonymously.

In one line: visitors talk a healthcare AI agent into leaking a credential or dumping patient records using nothing but plain English, then watch Microsoft Sentinel and a SOAR playbook cage it automatically in about 26 seconds.

Scope. This kit covers the **Theater** experience: the facilitated, interactive CTF. Delivery guidance for the unattended Lobby attract screen is in [lobby-demo-script.md](#).

Operator docs

Once you have decided to run it:

- [Set up at your Hub](#) — branding, join link, engine, checklist
- [Deploy to a Hub PC](#) — desktop shortcuts in one line
- [Deploy to Azure](#) — your own Static Web App
